Can e-commerce help Indonesia's economic during pandemic covid-19?

Nowadays, the trend of online shopping in millennial generation is significantly increased. Based on the government's advices to stay at home, so online shopping become alternative way to society fulfill their needed. As we know online shopping or E-commerce is a activities to buy and sale goods and service through electronic network, especially internet

First of all, I think that there is E-commerce so automaticly contribution to grow economic to buy and sale goods and service. With E-commerce obvious give an easy way to grow society of consume and increasingly impact for Gross Domestic Product, which this is general indicator for know economic growth in each year. In my opinion E-commerce not only help grow economic but for personal, this is also give an easy way to shopping. Because we don't need to go to store and get traffic jams.

In addition, based on the research from BPS that Indonesia's Gross Domestic Product on second quarter of 2020 minus up to 5,32% during pandemic covid-19. This is because unemployment significantly increased. Many of store or company have to closed. But digital economic especially E-commerce give contribution for economic growth. Based on the news of [kompas.com](https://www.kompas.com) digital economic contribute for Gross Domestic Product in 2018 up to 814 trillion or 5,5% from Gross Domestic Product.

To sump up, I believe that E-commerce can help Indonesia's economic during pandemic covid-19. Except give good impact for economic, it's to give us idea for open business during pandemic. If many people became entrepreneur so this is also can be alternative for government to decrease unemployment during pandemic covid-19.
