ABSTRACT

Human resources with good characters are badly needed in a national development. Hence, developing characters, especially the development of characters based on local wisdom is highly needed. This study was part of a study of local culture-based Physics model of teaching at senior high school, i.e., the need analysis and conceptual model prototype stage. The subjects were 20 physics teachers who had at least 10 years of teaching physics experience at public and private senior high schools in Singaraja, Bali. The study used questionnaire, observation guide, and interview as the instruments for collecting the data. The data were analyzed by a descriptive-qualitative analysis. The result showed that (1) Nine Balinese local wisdom-based characters could be developed in physics teaching; (2) The method that is appropriate for the local wisdom-based development of characters is inquiry from various perspectives, discussion, and demonstration; (3) The core procedure of teaching that can develop the students' character are exploration, focusing attention, inquiry from various perspectives (scientific, sociocultural, historical), elaboration, and confirmation.

INTRODUCTION

Character building is very important and urgent (Samani & Hariyanto, 2012). We have to start from building characters, ethics, and good behaviors to develop the nation of Indonesia. This nation actually has a superior and noble civilization. However, this idea has received less attention in educational process, as evidenced from the behaviors such as blaspheming using vulgar expressions both in a demonstration or a social media, broadcasting false news (hoax), bullying, engaging in gang fightings, doing dishonest acts (cheating, corruption, plagiarism), intolerance toward differences and laziness which are done by some people, children and the adults. This phenomenon could be taken to represent Indonesian characters. These phenomena indicate a failure in developing value education. The decadence of the students' morality which cause the bad characters is an indicator of the teachers' failure in integrating knowledge about values with positive actions (Lickona, 1999; Lopes et al., 2013; Abu et al., 2015; Aisah, 2014).

This statement is supported by Suastra (2010) who state that contemporary Science (Physics) teaching accommodates less local wisdom values that are full with virtues. Baker et al. (1995) states that of school Science teaching does not pay attention to the children's culture/local wisdoms, then, as the consequence, the students will “refuse” or only accept part of science...
concepts that they are learning. Local wisdom is defined as the truth that has become a tradition. Local genius, which is also often called local wisdom, can be understood as an effort of human beings who through their cognitions to act and behave toward an object, or an event that occurs in a particular space (Ridwan, 2007).

Wisdom, which etymologically means one’s ability in using one’s mind to position oneself in relation to an event, object or a situation, while the word local shows the space of interaction the event or situation takes place. Thus, local wisdom is substantially a norm that is binding in a community whose truth is believed by the community and whose existence is used as the reference in daily activities and behaviors. Thus, local wisdom is an entity that strongly determines the dignity of humans in their community (Geertz, 1992).

One form of local wisdom in the educational context (the student-teacher context) is expressed in the Brahmacari level, i.e., aguron-guron or Asewaka Guru in Acarya (the teachers who educate their students) by giving spiritual guidances, guidances about virtues, charity, dedication, or collectively called dharma. In addition to filling in the minds of the students with various knowledge (Castrantara), the teacher gives the first priority to character education (Punyatmadja, 1994).

The classroom teaching can develop the students’ characters in order to make the students to become the better ones (Aisah, 2014; Khusniati, 2012; 2014; Dianti, 2014). Based on the issue above, this article will discuss the following points: (1) the aspects of the local wisdom-based character which can be developed in Physics teaching; (2) the methods that are relevant in Physics teaching to develop the students’ characters based on local wisdom; and (3) the procedure of Physics teaching that can develop the students’ characters based on local wisdom at senior high schools.

### METHODS

This study was a two-year research and development. The first year part of the research was a study which analyzed needs in developing a teaching model and a conceptual model prototype design. The study involved 30 subjects who were senior high school Physics teachers who had taught Physics at least for ten years at senior high schools. The data collection instruments used were questionnaire, observation guide, and interview which had met the validity and reliability requirements. The data were analyzed by using a descriptive-qualitative analysis.

The stage of the analysis of Balinese local wisdoms that were needed as the basis for developing the students’ character was preceded by a review of relevant sources, the description of the aspects and indicators. Then the results of this review were incorporated into a questionnaire which was then given to the Physics teachers to be evaluated. The stage of teaching concepts review was done by reviewing relevant literature and focus group discussion (FGD) with senior high school Physics teachers who were selected as the sample of the study. The results were validated by three instructional experts. All of the data were analyzed descriptive-quantitively.

### RESULTS AND DISCUSSION

The result of the analysis of the needs of local wisdom-based characters which can be developed in senior high school Physics teaching covers: religious, telling the truths and be honest (satyam), tolerant (tat twam asi), responsible (sesa-na/swadharma), curious, shy, having a preference for working hard and generous, showing a concern and friendliness toward nature, and having the habit of doing self reflection (mulat sarira) and the indicators are as shown in Table 1.

</tbody>
</table>
The criteria of assessment used to assess the national characters in this study had the score range of 0 – 5 from appropriate/suitable (4.00) to very appropriate/very suitable (5.00). Table 1 shows that there are 9 aspects of good/positive character from Balinese local wisdom/local culture that can be developed in Physics teaching at school, i.e., religious, telling the truths and being honest, tolerant, responsible, curious, jengah, and self-reflecting (mulat sarira).

The Balinese local wisdom based characters were sought in the attitudes and behaviors of the people in their daily life which are inspired by the Hindu holy books such as Bhagavad gita, Rgveda, Atharwa veda, Sitalakramaning Agurong-guron, and Tri Kaya Parisudha. Other sources obtained from the philosophy that developed in Bali Community like Tri Hita Karana, which means a harmony between human beings and God (religious), human beings and their fellow human beings, and human beings and the universe. Suja (2000) states that the relation between human beings (Prajah) and God (Prajapati) is based on the concept of Kawula Gusti, which means God is Gusti (the ruler), while human beings are God’s servants with their sincere bhakti. The relation between human beings and their fellow human beings is based on the concept of Tat Twam Asi, which teaches that all humans are the same. We all (without being restricted by whatever label) are friends va suduiva kutum bhakam. As humans, we have to love each others, helps each other, and treat others just like what you want to be treated. The harmony of relation with natu-
is: you have to learn all your life because there is always something new for you to learn (i.e. long life education).

Based on the result of data analysis, it was found that the methods that can be developed for Physics are inquiry/investigation method (mean=4.75), discussion/question and answer (mean=4.63), and demonstration (mean=4.38). The most appropriate method to be developed is investigation/inquiry. Inquiry method is the most appropriate for developing science process, critical thinking, and scientific attitudes or scientific character (Hairida, 2016; Harlen, 1992; Neuby, 2010; Sumaji, 1998; Suastra et al., 2011; Neka et al., 2015; Trowbridge & Bybee, 1990; Wenning, 2005; Priyantini et al., 2015; Alpusari & Putra, 2015; Dwianto et al., 2017). Thus, Physics teaching does not only focus on the conceptual, process, and application dimensions, but it has developed the extension of the science education dimensions, i.e., to positive attitude, creativity, and the nature of science itself. (Enger & Yager, 2000); that is physics as product (Van Manen, 2016), physics as process (Van Joolingen et al., 2005), and physics as values (Ismail et al., 2013; Loke & Chow, 2007).

The stages in Physics teaching for developing local culture-based characters are: (a) exploration; (b) focusing; (c) inquiry/investigation from various perspectives (scientific, sociocultural, historical); (d) elaboration; and (e) confirmation and reflection. The stages of physics teaching can be seen in Figure 1.

At the beginning of the lesson the students pray together according to their respective religions and beliefs. This is meant to improve the students' awareness of the greatness of God and to thank God who has created this world with various phenomena that hide mysteries (spiritual character). In the exploration stage the students are invited to make observation, displaying a video or pictures of strange/ashtonishing natural phenomena (discrepant events), that will develop curiosity in them about the phenomena which will lead to some questions such as what, why, and how it can occurs. At this stage, there will develop jengah (ashamed when one cannot do or explain something), responsibility, the unfailling habit of telling the truths and being honest and concern about the natural environment.
Students are asked to express initial ideas and beliefs about the topics to be taught. Teacher does not say that the students’ ideas are true or false.

INITIAL ACTIVITIES
Teacher greets students and then leads a common prayer according to each’s respective religion, and belief before the lesson starts.

FOCUSING
Teacher facilitates and focuses on the problem being investigated. Students prepare facilities to investigate the problems and are being guided by Student Working Sheets.

INVESTIGATION /INQUIRY
Students in heterogeneous groups 3-4 students each group) do the inquiry in the laboratory or in a room from various perspectives (scientific, socio-cultural, and historical) Teachers facilitate and assess student performance in investigation activities.

ELABORATION
Students make a report of the result of their inquires
Students present the results of the inquires in front of the classroom and other students criticize or give comments politely
Teacher asks questions of open ended type to check the students’ basic competence and to monitor the character of the students during the lesson.

CONFIRMATION
Teacher gives a confirmation about the problem aroused which cannot be solved by the students in the discussion. Teacher gives a reinforcement or appreciation to the students who have contributed in the discussion.

CLOSING
Teacher invites students to sum up the content of the lesson
Teacher invites students to reflect on themselves (mulat sarina) about the acts that have been done both to themselves and to others
Teacher gives enrichment tasks
End with a common prayer and greetings

Figure 1. Flow of Activities in the Physics Teaching and Learning Process

The elaboration stage enables the students to relate physics lessons that they learned with the real world. This enables them to develop their reasoning. Both inductive and deductive reasoning. Since this stage is done in a heterogeneous groups, then it enables the occurrence of interactions among themselves who are different in terms of socioeconomic status, race, ethnics, and religion. The nurturing effect of this activity in this phase is the development of religiousness, telling the truths and honesty (satyam), tolerance (tat twam asi), responsibility (sesana/swadharma), curiosity, jengah, having a preference for working hard and generous, showing a concern and friendliness toward nature. At the confirmation phase the teacher has the role of giving an emphasis on scientific (correct) concepts and principles of physics and introducing and inviting the students to internalize good local character value.

Finally, at the final stage the teacher invites the students to reflect about their learning, thoughts, expressions, and acts that they have thought, said and done (Trikaya Parisuda). If they are wrong the students have to apologize, and if there is something that is lacking then they have to correct it in order in the future things will be better. Therefore, the role of a teacher is very important in the teaching and learning process, i.e., he or she has the role of a model, an active, creative and wise cultural broker, so that the students will obtain a learning experience that contains good virtues and sense of responsibility toward themselves, other people and the natural environment and socioculture (Aikenhead, 2000; Elmubarok, 2008; Suastra, 2005).
CONCLUSION

There are nine Balinese local wisdom-based characters which can be developed in Physics teaching at senior high school. These characters were sought from various sources as references, advice given by parents to children or the generation after them, and the results of discussions with community leaders and experienced teachers (at least 10 years experience). Conceptually, the core stage of Physics teaching at senior high school to develop characters based on Balinese local wisdom consisted of exploration, focusing, inquiry/investigation, elaboration, and confirmation.

Teacher is very important in the teaching and learning process, i.e. as a model and an active guide, who is active and creative in developing physics knowledge, science process skill, and good students’ characters, there is a need to do a research with wider scope with a larger number of respondents and a wider area and the empirical testing of the teaching model at school. There is a need to do a further research to know the effect of the model that has been developed especially in developing the local wisdom-based characters.
